Object: Use of Per- and Polyfluorinated alkyl substances (PFAS) and Perfluorooctanoic acid (PFOA)

Based on information provided to us from our raw material suppliers, and our general knowledge of the products' compositions, **Aston Seals** hereby declares that, with the exception of PTFE used in some products belonging to the SEALFLON product family and/or fluor-elastomer components, none of our products contain PFAS as intentionally added ingredients nor are the manufacturing processes used to produce the named parts expected to create any PFAS byproducts, as defined by the OECD (see "*Synthesis Paper On Per- And Polyfluorinated Chemicals (PFCS)*").

Products containing PTFE used in some products belonging to the SEALFLON product family and/or fluor-elastomer components contain one or more intentionally added fluoropolymer components that are classified as a PFAS as defined by the OECD (see "*Synthesis Paper On Per- And Polyfluorinated Chemicals (PFCS)*"). It is possible that during thermal processing and manufacturing steps, chemical reactions may occur that produce low concentrations of non-fluoropolymer PFAS, or low concentrations of non-fluoropolymer PFAS may exist as polymerization by-products or processing aids within the polymer matrix from the original polymer production process.

Aston Seals does not routinely analyze for the presence of PFAS components. The information provided herein is for general purposes and shall not be construed as a representation or warranty (either express or implied).
